

Expected value and variance:

$$E(x) = \mu \qquad Var(x) = \sigma^2$$

Short notation:

$$N(\mu,\sigma^2)$$
 e.g. $N(0,1)$

Standardisation:

$z = \frac{x - \mu}{\sigma}$	$f(z) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{z^2}{2}\right)$
$\mu = E(z) = 0$	$\sigma^2 = Var(z) = 1$

$r_r = \frac{\mu - \sigma - \mu}{\sigma} =$	-1	$z_{upper} = \frac{\mu}{2}$	$\frac{+\sigma-\mu}{\sigma}=1$
Width of	$\pm\sigma$	$\pm 2\sigma$	$\pm 3\sigma$
the interval	0.68268	0.9545	0.9973

The size of the produced parts (from a particular process) follows normal distribution. The expected value is 10, the variance is 0.25. The lower specification limit is 8.5 cm. What is the ratio of noncomforming parts from this process?
